

## ***A special at Sundrape: The roller blind that moves! Moveable roller blind type 7060***

The movable roller blind type 7060 perfectly combines the advantages of the sundrape® panel curtain system with the advantages of the sundrape® roller blinds. It offers not only a functional design, but also various possibilities for sun and glare protection. Adapted gliders care for a smooth gliding of the roller blind in the panel curtain rail and it can easily be moved according to the position of the sun. The possibility to set the height of the blind individually enables you to use the daylight better and you gain protection from bothersome effects of light without affecting the view outside.

Panel curtain rails are up to 6000 mm long and can manifold be connected per rail connector. Rails with 2 to 5 tracks or pairs of rails with more than 5 tracks offer a maximum scope of designs. To move 2 roller blinds one after another in one rail you need 5 tracks. Per stopper you can limit the tracks or adjust the wall distance.

A combination of fixed or movable panels in one rail is particularly decorative. And with the wide choice of sundrape® fabric collection almost every area can be fit out individually. All visible parts are of white colour.

This type can be used also for large glass areas up to a width of 2200 mm and a height of 3000 mm, especially when two roller blinds are being arranged successively or side by side in one rail.

The blinds are being moved by a plastic or high-grade steel ball chain which is mounted laterally.

Mounting is pretty simple and virtually does not differ from mounting the pure panel curtain rail with locking bolts. The tracks for the roller blinds are already premounted ready for use and you just have to hook in the blinds and adjust the stopper.
